## Dangers of the dark web

The dark web is a concealed segment of the internet that is used for both legitimate and illegal activities. Unlike the surface web, it cannot be accessed or indexed through standard search engines and browsers. Dark web monitoring helps identify instances where your organisation's email or Outlook credentials may be exposed, traded or sold within these hidden networks.

As cybercriminals continually evolve their tactics, proactive monitoring is essential.

## DarkPhish from Accelerator

### Threat

Stolen user credentials found on the dark web can indicate your organisations domain or third party application has been compromised.

### Alert

When we receive an alert, we run the report to identify the compromise. Following this we will advise you to instruct the affected employee to change their password immediately. Following an alert, we can enforce minimum password requirements.

### 24/7/365 Detection

DarkPhish monitors the dark web for threat intelligence about your organisations Office 365 domain details. We receive an alert in real-time when a compromise is detected.

### Reduce Future Risk

A main feature of DarkPhish is we send a phishing simulation campaign to the employee to empower them to identify future attacks. This phishing campaign can be sent to all employees.

## What is phishing?

Phishing is a form of social engineering and a scam. Attackers try to hook innocent parties through deceptive emails. This can take the form of bait to reveal sensitive information - for example a trusted person, or supplier or colleague. The result can lead to themnstalling malware such as viruses, worms, adware or ransomware.  Phishing attacks have become increasingly sophisticated.

## Phishing Simulation

Via DarkPhish, the compromised employee - or all employees - are sent an email based phishing simulation. This is designed to represent familiar, global brands, with the aim to record how the employee reacts.

We receive the report on the outcome of the phishing campaign and share with you:

- Did they click the link?
- Open an attachment?
- Re-set their Password on prompt?
- Did they forward the email to IT?

*65% of people use the same password for multiple or all accounts - potentially the same one they log into your business network*

## DarkPhish Training Videos

When security is compromised and behaviours are identified, DarkPhish delivers educational videos to the user. Each video has a quiz at the end to test the training content and retention by the employee. Results of the test are shared back to the end user.

Security awareness training and phishing simulations go hand in hand to reduce the likelihood of security breaches.

**Let us help safeguard your organisation and prevent critical interruptions to your business operations.**
